Welcome

WTF? Business Case?

Can we earn money with botnets?

Thorsten Kraft

Anti-Abuse Engineer

(Expert Abuse Department)

What kind of impact do botnets have for ISPs

– financial:

- → spam E-Mails (costs for flter technics and hardware)
- → network traffic ("interconnect costs")

– infrastructural threats:

- → attacks against provider infrastructure (e.g. name servers)
- → can cause problems for the stability of a providers network

reputational damage:

- → IP/network ranges "flashes up" on blacklists
- → service restrictions; lower service quality
- → customers might have less confidence in company and the offered services

Basics of the discussion for joining ABBZ

- The main customer base don't care about the problems they have on their machine:
 - → "Is this really an email of my ISP?"
 - → "Do they wanna offer me something?"
 - → "what the heck? It's just a computer!"
- Who should pay for the needed customers support?
 - → "Why should an ISP be responsible for the infections? There are many other companies, like banks, having more benefit of cleaning up the PCs."
 - → "Do I now have to train my support guys to anti-virus experts? Or do I need to build up a new, separate support desk?
 - → "How far should we do support on that topic?"

Solution: The public awareness need to be edged for the problem and the whole internet community has to work together!

The project: "Anti-Botnet Beratungszentrum"

- the idea was born in June 2009 and addressed to eco by 1&1
- 2009, 8th December: Government announced the initative on the IT-Gipfel in Stuttgart
- Launched: 2010, 15th September (for at least 18 month)

How does the "Anti-Botnet Beratungszentrum" (botfrei.de) work?

- ISP identifies infected machines, notifies his customers and give them first instructions to solve the issues
- the anti-virus industry designs so called "DE-Cleaner" for free, being able to detect and delete the "claimed and identified" infections
- eco/BSI setup a specialized call center that is able to support helpless customers, having problems in this difficult situation

5 steps to the "Anti-Botnet-Beratungszentrum"

"Sicherheit in automatisierten Prozessen zu gewährleisten, ist nicht nur eine Frage menschlicher Verpflichtung, sondern auch von wirtschaftlicher Vernunft."

- Zitat aus dem Jahre 1880 von Werner von Siemens

the support process of an abuse case for botnet infected machines:

complaint / notice	scoring rules	escalation	First Aid	ABBZ
sorting out: → customer → infection → source → aggregation	 depending on the TrustLevel of the source or complainant contract- and problem based 	thresholds decide when/ who will be informed by which way → e-Mail → Service Call	 step-by-step instructions pointing to www.botfrei.de giving out a free voucher for getting support 	 Public awerness supporting the customers in using the "DE-Cleaners" prevention

Let us work together!!!

- botnets aren't a problem of internet/access service providers, they are a global threat
- the support is the same: at each single ISP and we need a high quality on that
- the Japanese "CyberCleanCenter" has made good experiences on that model
 → participating ISPs have "cleaner" networks
- the "Anti-Botnet-Beratungszentrum" reduces costs for ISPs and saves a lot of money in different ways:
 - 1. financial
 - 2. infrastructural
 - 3. reputational
- → 1&1 and eco/BSI would like you to join the initative. Let's make things done!
